

Executive Summary Template

Recommended Solution

- Implement a customer churn prediction program to proactively identify at-risk SME customers and support targeted retention campaigns.
- Continue improving the model through class balancing (SMOTE) and hyperparameter tuning before full deployment.

Situation

- The energy provider is experiencing customer churn, resulting in revenue loss and increased customer acquisition costs.
- Historical customer consumption, pricing, and margin data are available for analysis.

Complication

- The current churn prediction model misses a significant proportion of customers who are likely to leave, limiting its effectiveness for retention campaigns.
- Customer churn is influenced by multiple factors, making it difficult to identify at-risk customers without advanced analytics.

Question

- How can the company proactively identify customers at risk of churn and reduce revenue loss through targeted retention efforts?
